

company profile

AGRIFOOD TECH AND WEB APPLICATIONS

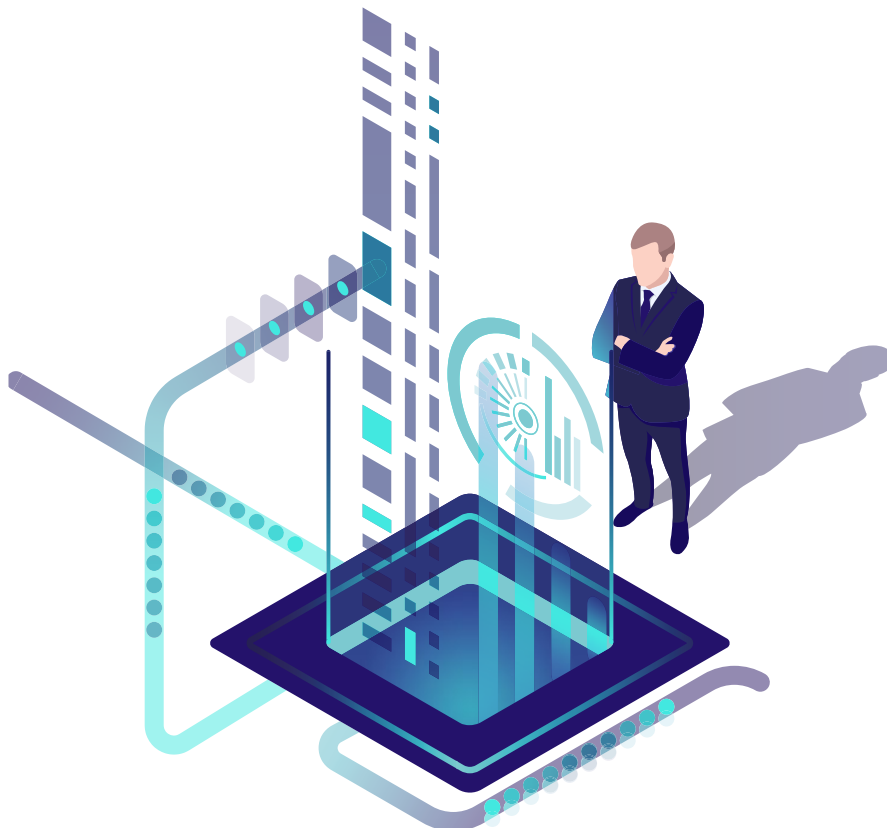

HT is a software house with core businesses in agrifood tech and web applications. The expertise, gained since 2004, allowed the development of JO Hall 2.0, an user friendly management software suitable for all kind of enterprises, and of JO Badge Online, an innovative app that allows in a fast and precise way the monitoring of employees' behaviours (entries, exits and trips).

HT boasts the participation in international R&D projects in association with companies and public bodies all over Europe.

AGRIFOOD TECH

Blockchain, IoT and machine learning are very important digital technologies for agrifood tech and, thanks to their innovative methodologies, important improvements are being made in the agrifood sector, field so important for made in Italy. HT is involved, for example, in the production of digital solutions to improve the tracking of products or in the use of the latest innovations of sensors and artificial intelligence (AI) or in realising UAVs which monitor arboreal and herbaceous crops so to improve the productivity and quality of the products.

WEB APPLICATIONS

HT focuses especially on the ease of use and the stability of the solutions adopted, based on the most efficient web technologies. A software could have problems that are not visible at first sight. They can depend on how its design, its code and many other technical variables, unknown to non-experts. The choice of the provider of a tailored web application must have the same *modus operandi* as that of a professional, so a relationship based on trust turns to be essential. This is why HT bases its success on the reliability of the proposed web applications.
